BAPIRLO OS — EMERGENCY SHEET

Laptop: MSI Pulse 16 · CachyOS + GNOME 51 · Linux = `nvme0n1p6` (ext4, 150 GB) · Windows = `nvme0n1p3` · EFI = `nvme0n1p1` **Never** format, resize or "repair" `p1` (EFI) or `p3` / `p4` / `p5` (Windows).

1 · DESKTOP FROZEN

1. **Esc**, then **Super**, then **Super** + **Escape** — closes stuck menus / gives keys back.
2. **Ctrl** + **Alt** + **F3** → log in → `bapirlo-doctor`
3. All extensions off, live: `export DBUS_SESSION_BUS_ADDRESS=unix:path=/run/user/$(id -u)/bus` `gsettings set org.gnome.shell disable-user-extensions true` → **Ctrl** + **Alt** + **F8** back to the desktop
4. Restart the desktop (unsaved work lost): `sudo systemctl restart lightdm`
5. Last resort: hold power 10 s.

2 · EXTENSION GONE AFTER AN UPDATE

Extension Manager → Updates. Bapirlo's own ones: code in `~/bapirlo-os` (add the new GNOME number to `metadata.json`, log out/in). Shell crashes at login → TTY step 3 above.

3 · LOGIN SCREEN BROKEN

Ctrl + **Alt** + **F3** → `sudo bapirlo-greeter-revert` → `sudo systemctl restart lightdm` (plain login screen).

4 · NO WI-FI

`nmcli radio wifi on` · `rfkill unblock all` · `sudo systemctl restart NetworkManager` · after a kernel update: **reboot**. No luck → phone hotspot / USB-C Ethernet.

5 · WON'T BOOT

- At the MSI logo: **F11** = boot picker → **Limine** → CachyOS. Tap **Esc** while GRUB starts for its menu → fallback kernel **linux-cachyos**.
- Splash stuck: **Esc** shows messages; wait 1 min; then **Ctrl** + **Alt** + **F3**.
- Broke after an update (desktop or TTY works): `sudo timeshift --list` → `sudo timeshift --restore --snapshot '<name>' --skip-grub`

6 · RESTORE FROM THE CACHYOS USB (NOTHING BOOTS)

1. USB in → **F11** at the MSI logo → USB (UEFI) → live desktop → Wi-Fi → terminal.
2. `sudo pacman -Sy --needed timeshift`
3. `sudo timeshift --list --snapshot-device /dev/nvme0n1p6`
4. `sudo timeshift --restore --snapshot-device /dev/nvme0n1p6 --target /dev/nvme0n1p6 --snapshot '<name>' --skip-grub` (`<name>` like `2026-10-12_18-00-00`; pick **Bapirlo OS final** or the newest **Before update**.)
5. **Don't reinstall the bootloader.** Never choose `p1` or `p3`. Remove USB → reboot.

7 · WINDOWS

- Switch: Start menu → **Restart to Windows** (one boot only) · or **F11** → Windows Boot Manager.
- Windows drive is read-only from Linux. Write only via `bapirlo-windows rw` (refuses if unsafe), then `bapirlo-windows ro`.
- **Never write to Windows with Fast Startup / hibernation on.** Never enable BitLocker without saving the recovery key to your Microsoft account.
- Clock 1 h off → in Windows run `C:\Shared\Fix clock for Linux (double-click).reg` once.

8 · UNDO

One change: `bash ~/bapirlo-os/<script>.sh restore` · everything: Timeshift → **Bapirlo OS final** → Restore. Full manual: Start menu → **Bapirlo OS Guide** · `~/bapirlo-os/MANUAL.md`
